
Teachers: Before each lesson in the OTC Medicine Safety program, inform students that they should never take medicine without the supervision of a parent or trusted adult.

Objectives
- Identify information found in dosing instructions on Drug Facts labels (when, how, and how often to take the medicine).
- Explain the importance of reading and understanding dosing information.
- Understand why using proper dosing tools is important.
- Discuss possible consequences of not following dosing instructions.
- Describe what makes a location safe or unsafe for medicine storage.
- Identify potential consequences of unsafe medicine storage.
- Brainstorm ways students can talk to family members about safe medicine storage.

Materials:
- Student Worksheet 3
- Pediatric medicine bottle filled with colored water
- Dosing device that came with pediatric medicine
- Adult medicine bottle filled with different-colored water
- Dosing device that came with adult medicine
- Kitchen spoons (of different sizes)
- Student Worksheet 5
- Paper and pen or pencil
- OTC Medicine Safety’s family newsletter resource
- Internet access (optional, for lesson Extension)

Visit the homepage at scholastic.com/OTCmedsafety for additional lesson plans and a variety of resources to support these discussions both inside the classroom and at home.

Time: One 40-minute class period

Key Vocabulary
- Dose or dosage: The term “dose” refers to the amount of medicine that you should take or administer to a member of your family—as indicated by the “Directions” section of the Drug Facts label.
- Dosing device: A dosing device is the syringe, cup, or other receptacle that is packaged with your over-the-counter (OTC) medicine, meant specifically for use with that medicine. Dosing devices are customized to each medicine—you should never substitute a dosing device with kitchen spoons or any other household measuring device.

Lesson Steps
1. Begin with a class discussion about the importance of using the right tools when measuring different things. Ask students:
   Q: If I wanted to measure how far it is from the school to my house, would I use a ruler? Why or why not?
   Q: What are some different ways that people make mistakes when measuring things out?
LESSON 3: Medicine Measuring Tools and Storage

2. Encourage students to think about why accurate measurements are important. Ask:
   Q: When is it okay to get less-accurate measurements or even to estimate?
   Q: When is it important to get really accurate measurements? Why?

3. Ask students to think back to Lesson 2: Reading and Understanding the Drug Facts Label.
   Q: Do you remember which section of the label talks about how much medicine to take?
   Discuss different information contained in the Directions section of the Drug Facts label (amount of medicine to take, how often to take the medicine, and how to take it). If you deem it appropriate, display the classroom poster of the Drug Facts label. Explain that students are going to learn why reading and understanding dosing instructions is important, and why medicines should always be measured using the proper dosing devices under adult supervision.

4. Show students the different medicine bottles (filled with colored water) and measuring devices.

5. Read dosing information for the pediatric medicine. Then try to measure out the correct dose using the dosing devices that are not meant for the pediatric medicine. Reflect on the results. Next, measure out the dose using the correct dosing device. Discuss with the class why using the correct device is important.

6. Repeat activity with adult medicine, but try to measure it out with devices that are too small for the correct dose. Reiterate the potential dangers of using the wrong device and why using the correct one is important.

7. Show students a medicine bottle that recommends a dose of 2 teaspoons of medicine. Then take out a handful of different-size household spoons, the kind that students might find in their kitchen drawers at home. Measure out 2 spoonfuls of “medicine” into any of the spoons, pouring the measured liquid into a dosing cup that has an accurate measurement for 2 teaspoons. Discuss the discrepancy with the class.

8. Distribute Student Worksheet 3.

9. Have students complete the worksheet; this can either be done individually or you can lead the class and work through it together, discussing each example.

10. Talk about how measuring doses incorrectly (measuring out tablespoons instead of teaspoons, for example) can cause an overdose or underdose. Reinforce the importance of always communicating with a trusted adult before taking any medicine. Connect this discussion with a brief introduction to safe storage, which, when ignored, may lead to accidental ingestion and medicine poisoning.

11. Ask students to name the locations where medicines are stored in their households. Write answers on the board for students to refer to later. Common answers may include kitchen cabinets, bathroom cabinets, or parents’ or trusted adult’s bedroom.

12. As students answer, ask for specifics.
   Q: Are the medicines in drawers or cabinets or on the countertop?
   Q: Are the medicines easy for young children to see or reach?
   Get students thinking about how easy it is for young children in the house to find them. Explain that medicines need to be kept out of reach and sight of their naturally curious younger brothers and sisters, or young visitors to their home.

13. If using a whiteboard, visit upandaway.org to learn more, and as a class, watch the Safe Kids video and discuss the key messages.

14. Distribute Student Worksheet 5. Explain to students that they are looking at the inside of a home and it is their job to identify the medicine storage errors that could lead to accidental medicine poisoning.
LESSON 3: Medicine Measuring Tools and Storage

15. After the students have completed their worksheets, continue the discussion.
   
   Q: What did you learn about safe storage?
   
   Q: Is there anything from today’s discussion that might be important to mention at home?

Extension: Give students an assignment to create an idea for an app that can help families remember all of the ways to make a home medicine-safe. Research for the app idea may involve connecting with a local health expert (pharmacist, nurse, etc.) or an expert from an organization similar to Safe Kids via email for insight.

Conclusion and At-Home Connection

After you’ve discussed safe storage of OTC medicines as well as being mindful of the importance of reading and understanding dosing information, explain that you’ll be moving on to misuse in Lesson 4. Send home the Family Newsletter resource available in the Families Section at scholastic.com/OTCmedsafety/parents so students may continue the discussion at home. Encourage students to discuss what they have learned about the Poison Help number, to post the number in a visible place in their homes, and to get family members to save the number in their mobile phones.
### STUDENT WORKSHEET 3

Directions: Below is a sample dosing table for an over-the-counter (OTC) medicine, similar to the information you can find on a Drug Facts label. Use the table as well as your knowledge about medicine safety to answer the questions below.

<table>
<thead>
<tr>
<th>Age Group</th>
<th>Dosage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Children under 6 years of age</td>
<td>Ask a doctor</td>
</tr>
<tr>
<td>Children 6 to under 12 years of age</td>
<td>2.5 mL (½ teaspoonful) two times per day; do not give more than 5 mL (1 teaspoonful) in 24 hours</td>
</tr>
<tr>
<td>Adults and children 12 years of age and over</td>
<td>5 mL (1 teaspoonful) two times per day; do not take more than 10 mL (2 teaspoonfuls) in 24 hours</td>
</tr>
<tr>
<td>Adults 65 years of age and over</td>
<td>5 mL (1 teaspoonful) two times per day; do not take more than 10 mL (2 teaspoonfuls) in 24 hours</td>
</tr>
</tbody>
</table>

### QUESTIONS

1. Olivia is 12 years old and took her first dose of medicine at 8 a.m. She took a second dose at 3 p.m. the same day. By the evening, she is still not feeling better. Based on the label above, when can Olivia’s parents give her another dose of this medicine?

2. What might happen if someone taking this medicine used a household kitchen spoon to dose instead of the measuring device that came with the medicine?

3. What are some reasons a Drug Facts label might include instructions for certain people to ask a doctor before using the medicine?

4. Why is it important to always discuss medicine dosing with a parent or trusted adult?

5. How can you use what you’ve learned today about dosing to help your family use OTC medicines more safely?

---

**Did you know?** It wasn’t until 1999 that the FDA standardized the Drug Facts label found on all OTC medicines to ensure that consumers can easily and quickly identify how to take a medicine, who should take the medicine, the purpose of the medicine, and more. [READ ABOUT IT AT: www.fda.gov/Drugs/Resourcesforyou.](http://www.fda.gov/Drugs/Resourcesforyou)
