

Dolphins

Dolphins send messages to each other. They squeak, chirp, and whistle! Use their bodies to talk, too. Their tails slap on the surface of the water.

The Moon

we see the moon at night. This planet is close to Earth. Its surface is covered with dust and rocks. Twelve people have walked on the moon. I want to go there!

Plants and Animals

Plants and animals are both living things. Animals can move from place to place. Plants cannot move that way. Plants need water, so they have roots to get rain from the soil. Animals can eat plants or other animals for food. Plants make their own food.

Bees

Bees are important. Without bees, many flowers and plants would die! Bees have stingers to protect themselves! They usually don't sting but if you swat at a bee . . . watch out! It might sting you. OUCH. Be careful not to step on bees or go near their hive. They have jobs to do.

Hiccups!

Once, I got the hiccups. They wouldn't stop. At first, it was funny. Later, it wasn't. It took a long time for them to stop. I was worn out!

Raccoon

He waits for night. He searches around the garbage cans. Crash! He tips one over. He finds a tasty treat.

The Best Pet

Purr. Meeee-ow. Do you want a furry pet that is also playful and fun? Then you want a kitten! Kittens are the best pet because they like to play. They are also very soft and cute!

Sea Turtles' Journey

After laying about 115 eggs, the female sea turtle carefully hides them and trudges across the sand back to her home. A few months later, the babies use special "egg teeth" to break through their shells and hatch. From the nest to the ocean, they will face hungry birds, crabs, and other animals. Will they make it to their new homes, safe in the sea?
